Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

## Description

### BACKGROUND OF THE INVENTION

Specific chromosomal rearrangements, predominantly translocations and inversions, are observed in the great majority of human hematopoietic malignancies. In Burkitt lymphoma the specific chromosomal translocations result in the juxtaposition of one of the three human immunoglobulin loci and the *c-myc* oncogene. In diffuse B-cell lymphomas, multiple myelomas and chronic lymphocytic leukemias of the B-cell type carrying the t(11;14) (q13;q32) chromosome translocation, the *bcl-1* locus is translocated to the heavy-chain locus on chromosome 14. In most cases of follicular lymphoma, one of the most common human hematopoietic malignancies, a t(14;18) (q32;q21) chromosome translocation has been observed. This translocation moves the *bcl-2* gene to a position adjacent to the heavy-chain locus. In one cell line derived from a leukemic patient having both a t(14;8) and a t(14;18) translocation enhanced mRNA production from the *bcl-2* gene was observed. (Tsujimoto et al, Science, Vol. 228, pages 1440-1443 (1985).) It was concluded there that the transcription unit of the *bcl-2* gene spans the chromosome break-point, and thus the oncogene protein is likely to be structurally altered in the B-cell neoplasms. Surprisingly, it has now been found that the translocation does not alter the oncogene protein itself, as the translocation break-points occur downstream from the actual protein coding sequences. Thus oncogenesis may be solely due to the overproduction of the normal human gene products of the *bcl-2* gene.

Effective treatment for cancer is often dependent upon an early and proper diagnosis of the malignancy. There is thus a need for simple and accurate diagnostic methods for detecting and identifying human malignancies, such as follicular lymphomas, in general, and follicular lymphomas in particular.

### SUMMARY OF THE INVENTION

It is an object of the present invention to provide a diagnostic method for detecting B-cell neoplasms having t(14;18) translocations in a human.

It is another object of the present invention to provide a human *bcl-2* gene which can be expressed in bacteria.

It is yet another object of the present invention to provide a substantially pure protein preparation of a *bcl-2* gene product.

It is still another object of the present invention to provide a diagnostic method of detecting B-cell

neoplasms employing an antibody which is immunoreactive with a *bcl-2* gene product.

These and other objects of the invention are achieved by one or more of the following embodiments.

In one embodiment a diagnostic method for detecting B-cell neoplasms in a human is provided, comprising the steps of:

isolating B-cells from the human;  
extracting proteins from said B-cells to form a test sample;

contacting said test sample with an antibody which is immunoreactive with a gene product of the human *bcl-2* gene, under conditions where antibody-antigen complexes are formed and are stable;

quantitating the amount of antibody-antigen complexes formed with said test sample; and

comparing the amount of antibody-antigen complexes formed with said test sample to the amount formed with a control sample of proteins, a ratio of test sample complexes to control sample complexes of greater than about ten indicating B-cell neoplasm, said control sample of proteins extracted from cells selected from the group consisting of: B-cells from a normal human, cells from an established normal B-cell or pre-B-cell line, and non-B-cells from said human.

Also provided are forms of the human *bcl-2* gene which are substantially free of introns. Such genes can be replicated and expressed in bacteria to form proteins having the same primary structure as the *bcl-2* proteins produced in humans.

Also provided by the present invention are substantially pure preparations of proteins having an N-terminal end encoded by the first exon of the human *bcl-2* gene.

In yet another embodiment of the present invention a diagnostic method for detecting B-cell neoplasms in a human is provided comprising the steps of:

isolating B-cells from the humans;  
extracting RNA from said B-cells to form a test sample;

contacting said test sample with a DNA probe containing a sequence of at least 15 nucleotides in length derived from the human *bcl-2* gene, under conditions where homologous RNA-DNA hybrids form and are stable;

quantitating the amount of RNA-DNA hybrids formed with the test sample; and

comparing the amount of RNA-DNA hybrids formed with said test sample to the amount formed with a control sample of RNA, a ratio of test sample hybrids to control sample hybrids of greater than about ten indicating B-cell neoplasm, said control sample of RNA extracted from cells selected from the group consisting of: B-cells from a

normal human, cells from a normal B-cell or pre-B-cell line, and non-B-cells from said human.

#### BRIEF DESCRIPTION OF THE FIGURES

Figure 1 shows a genomic restriction map of chromosome 18, and the structure of cDNA clones.

Figure 2 shows the nucleotide sequence of bcl-2 cDNA corresponding to the 5.5 kb transcript. Only the sequences surrounding the open reading frame are shown.

Figure 3 shows the nucleotide sequence of bcl-2 cDNA corresponding to the 3.5 kb transcript. Only the sequences surrounding the open reading frame are shown.

#### DETAILED DESCRIPTION OF THE INVENTION

According to one aspect of the present invention it has been discovered that B-cell neoplasms which are associated with t(14;18) chromosome translocations cause an increase in the expression of both the mRNA and the protein products of the bcl-2 gene. The expression in the neoplastic B-cells is generally about ten-fold higher than the amount expressed by normal cells. This elevated expression can be used as a diagnostic tool to detect the B-cell neoplasms in humans. Such neoplasms include follicular lymphomas as well as other lymphomas.

It has been found that three species of mRNA are transcribed from the bcl-2 gene. At least two different protein products have been identified. A 239 amino acid protein, designated bcl-2-alpha is translated from a 5.5 kb mRNA. A protein of 205 amino acids, bcl-2-beta is translated from a 3.5 kb mRNA. It is thought that bcl-2-alpha is also translated from the 8.5 kb mRNA species. All three size species of transcript share substantial sequence homology in the 5' portion of the gene, termed the first exon or 5' exon. The larger two transcripts appear to be spliced to a second exon which is at least 50 kb distal to the first. The splice site is in the midst of the protein coding sequence. Thus, the 3.5. kb transcript codes for a protein having a different carboxyl terminus than the proteins coded by the two larger sized transcripts.

The hotspot for chromosome break-points among the t(14;18) translocations of follicular lymphomas map 3' to the protein coding region. Therefore it has now been found that the translocations do not alter the primary structure of the protein products.

Bacterial isolates available from the ATCC, under Accession Numbers 67147 and 67148, can be used to express bcl-2 gene products alpha and beta, respectively, in bacteria. The clones of the bcl-2 gene were obtained via cDNA cloning and so

do not contain introns. Thus these clones can be expressed in bacteria to make products having the same primary sequence as those made in the human body. After growing the bacteria under suitable conditions which are well known in the art, the cells can be harvested and disrupted to extract total cellular protein. The protein can then, for example, be placed on a sizing column such as Sepharose™ or agarose beads, and proteins of the correct molecular weight, i.e., between about 20 and 30 kD can be collected.

Further purification can be effected by use of an anti-bcl-2 antibody. Such an antibody can be used to immunoprecipitate bcl-2 proteins from the set of cellular proteins of the correct approximate molecular weight. Such antibodies can, for example, be raised against polypeptides synthesized according to the sequence shown in Figures 2 and 3. Alternatively, the antibodies can be raised against fusion proteins, which contain bcl-2 sequences as well as those of another protein. An example of an antibody raised to a fusion protein is discussed, *infra*. After immunoprecipitation, the bcl-2 proteins can be released from the antibodies to provide a substantially pure preparation of bcl-2 proteins.

If it is desired that bcl-2-alpha (approximately 26 kD) be separated from bcl-2-beta (approximately 22 kD) this separation can be achieved using either polyacrylamide gels or additional sizing or gel filtration columns. Of course, other separations are possible based on the inherent differences between the two proteins at their carboxyl termini. Techniques for using gel filtration columns and immunoprecipitation and antibody releasing are all well known in the art.

Any source of B-cells is suitable for use in the diagnostic test of this invention. B-cells can be isolated from the lymph nodes. Alternatively, the diagnostic test may employ a sample of peripheral blood obtained from an individual who is being screened for the presence of a B-cell neoplasm. Means for separating B-cells from the peripheral blood are well known in the art. For example, erythrocytes and granulocytes may be separated from the B-cells by centrifugation in a liquid having a density intermediate between the groups of cells to be separated.

Extraction of proteins from B-cells may be performed by any of the many means known in the art. For example, cells may be lysed by a detergent or by mechanical means. If desired, nucleic acids can be removed from the cell preparation by enzymatic digestion or by precipitation with agents such as streptomycin. Once again, such means are well known in the art.

Antibodies can be generated which are immunoreactive with the bcl-2 proteins by immuniza-

tion of animals with a fusion protein consisting of a portion of the beta-galactosidase protein of *E. coli* and a portion of the human bcl-2 proteins. Preferably, the bcl-2 portion will contain sequences which are common to both bcl-2-alpha and bcl-2-beta. If desired, such a fusion protein can be purified using the properties which it shares with beta-galactosidase. Anti-sera raised against such a fusion protein in rabbits have been found to be immunoreactive with both bcl-2-alpha and bcl-2-beta *in vitro*. Furthermore, using this anti-sera in immunofluorescent techniques it is possible to determine cellular location of bcl-2 proteins in cells which have been fixed.

Antibodies can also be produced by immunization of animals, such as mice, rabbits and the like, with bcl-2-alpha, bcl-2-beta, fragments of them, or both. Alternatively, monoclonal antibodies can be generated using immortalized cell lines to provide uniform and continual antibody sources. Techniques for generating such antibodies are well known in the art. Appropriate antibodies can be screened using the natural gene products of bcl-2 or the fusion protein discussed above. While it is preferred that the antibody used in the diagnostic method immunoreact with both bcl-2-alpha and beta, an antibody may successfully be used which immunoreacts with only one of them.

The extracted proteins from the B-cells may be contacted with the antibody under suitable conditions for antibody-antigen complex formation. Generally, such conditions are physiological conditions. The protein extract may be bound to a solid support such as a nitrocellulose filter or a microtiter plate.

The antibody will generally bear a "tag" such as a radiolabel, a fluorescent label or an enzyme conjugate which under appropriate conditions produces a colored reaction product. Once again, such "tags" are quite well known in the art. Alternatively, if the antibody is not tagged, it can be detected by means of a second antibody from another species which is reacted with the first antibody. Of course, it is preferred for means of this diagnostic method that the immunological technique be as quantitatively sensitive as possible.

Means of detection of the antibody-antigen complexes will depend upon the method of tagging used for the antibody. For example, radiolabel tags can be detected by autoradiography or scintillation counting, while the products of enzyme-linked antibodies can be detected spectrophotometrically.

A parallel sample to the test sample is employed to provide the control. The control sample consists of an equivalent amount of proteins extracted from cells, preferably in the same manner as those of the test sample. The amount of protein can readily be determined employing techniques

well known in the art, such as the Lowry or Bradford techniques. The cells used for preparing the control sample may be selected from the group consisting of B-cells from a normal human, cells from an established normal B-cell or pre-B-cell line, and non-B-cells from the human who is being screened for the neoplasm.

It is a finding of the present invention that in cases where a translocation has occurred between chromosomes 14 and 18 the level of bcl-2 protein detected immunologically in the B-cells is at least 10-fold higher than the amount of bcl-2 protein found in normal B-cells, in pre-B-cells, or in other non-B-cells from the same human.

To screen for elevated levels of mRNA transcribed from the bcl-2 gene, again one must isolate B-cells from the human who is to be screened. Any of the many methods known in the art are suitable. Total RNA extracted from the B-cells may be used, or alternatively mRNA may be isolated from the total cellular RNA. The mRNA may be purified, for example, by affinity chromatography on oligo(dT) cellulose which binds to the poly(A) tract at the 3' end of most mRNA. As is well known to those of skill in the art, it is essential that ribonuclease activity be minimized during preparation and assaying.

A DNA probe may be selected from any of the protein coding sequences of the bcl-2 gene. Preferably, the probe will be selected from sequences of the 5' or first exon of the gene, so that all three species of RNA can be detected. Alternatively the probe can be selected from sequences which hybridize exclusively with the 3.5 kb transcript or only with the 5.5 kb and the 8.5 kb transcript. Preferably the probe contains at least 15 nucleotides of the bcl-2 sequence. Suitable plasmid molecules which may be used as probes have been deposited at the ATCC under Deposit Numbers 67147 and 67148. Of course, other suitable probes may be synthesized or derived from these or other bcl-2 sequences. In order to perform the hybridization it is desirable that the probe be single stranded. Thus if the probe is double stranded, it should be denatured to single stranded form. Means for denaturing are well known in the art, including alkali or heat treatment. The probe can then be contacted with the RNA derived from the B-cells under conditions where homologous RNA-DNA hybrids form and are stable. Such conditions are well known in the art. Means for detecting hybrids are many and well known, but often involves use of radiolabeled probes and nucleases which degrade single stranded DNA. Other methods may be used.

Control samples can be derived from any of the cell sources described above for use in the antibody diagnostic test. Samples and control should be prepared in parallel under similar con-

ditions. If comparison of the test and control sample hybridization shows a greater than about a ten-fold excess in the test sample, a B-cell neoplasm is indicated.

The following examples do not limit the scope of the invention but are merely illustrative.

#### EXAMPLE I

A cDNA library from polyA<sup>+</sup> mRNA of the pre-B-cell leukemia cell line 380 was constructed. Cytoplasmic RNA was extracted by the procedure described in ar-Rushdi, et al (1982) *Somatic Cell Genetics*, Vol. 8, pp. 151-161. PolyA<sup>+</sup> RNA was selected by oligo(dT) column chromatography as described in Aviv and Leder, (1972) *Proceedings of National Academy of Sciences, USA*, Vol. 69, pp. 1408-1412. Double stranded cDNA was synthesized from mRNA by reverse transcriptase (Life Science, Inc., Florida) using oligo(dT) as primer as described in Maniatis et al (1982) *Molecular Cloning*, Cold Spring Harbor Laboratory, Cold Spring Harbor, New York. After EcoRI linker ligation, the double stranded cDNA was cloned into lambda gt 11 phage vectors, Young and Davis (1983) *Proceedings of the National Academy of Sciences, USA*, Vol. 80, pp. 1194-1198. By screening approximately  $2 \times 10^5$  recombinant clones with a DNA probe consisting of a segment of chromosome 18 which spans the hotspot of break-points of the translocation of chromosome 18 to chromosome 14, three independent cDNA clones were obtained which are overlapping (B3, B4, and B10). As shown in Figure 1, clone B3 contains nineteen A residues at the end, indicating that this clone represents the 3' end of the mRNA. The restriction maps of the cDNA clones and genomic sequences are colinear from the 3' end of cDNA clone B3 until just before the BamHI site of the cDNA sequence. The cDNA sequence just beyond this point diverges from the genomic sequence. Thus, the cDNA sequences consist of at least two genomic regions.

When the 5' part of cDNA clone B4 (5' end to the BamHI site) is used to probe the cDNA bank, another set of clones is obtained, including clone B15 and clone B16 (see Fig. 1). These two cDNA clones have the same sequences at the 5' region as does clone B4, but they have totally different sequences at the 3' region than do clones B3, B4, and B10. Thus cDNA cloning has yielded two different sets of clones, indicating that the bcl-2 gene is transcribed into at least two different mRNAs.

In order to obtain cDNA sequences further upstream (in the 5' direction), a cDNA library was constructed using the primer extension method. An oligonucleotide (15-mer) was synthesized and used as a primer for reverse transcriptase as described

in Maniatis, *supra*, and in Gubler and Hoffman (1983) *Gene*, Vol. 25, pp. 263-269. Three clones were obtained by this method, clone B6-3, B22-1, and B9.

#### EXAMPLE II

Two different probes were used to visualize the mRNA species corresponding to the bcl-2 gene in Northern blot hybridizations. The first probe (probe A in Figure 1) contains genomic DNA of chromosome 18 which spans the break-point hotspot and also corresponds to the 3' exon. The other probe used was cDNA clone B22-1 which corresponds to the 5' exon (the first exon). RNA was glyoxalated, run on 1% agarose gels, and blotted to nitrocellulose filters as described in Thomas, *Proceedings of the National Academy of Sciences, USA* (1980) Vol. 77, pp. 5201-5205. The nitrocellulose filter was hybridized with <sup>32</sup>P-labelled probe in 50% formamide, 4 X SSC, 0.1% SDS at 37°C and finally washed with 2 X SSC (0.3M NaCl, 0.03 M Na-citrate, pH 7) at 65°C.

The genomic DNA probe A detected two transcripts, 8.5 kb and 5.5 kb in length. The cDNA probe B22-1 detected the same transcripts as probe A, as well as an additional transcript of 3.5 kb.

The 8.5 kb mRNA was also shown to hybridize to a genomic DNA probe from chromosome 18 which is 3' to genomic probe A (and is indicated in Fig. 1 as probe B).

These data indicate that the bcl-2 gene is transcribed into three mRNAs of different sizes. The possibility that these mRNAs are derived from different but related genes is excluded by the fact that under the same hybridization conditions which were used for the Northern blot hybridization, these probes detect only one cellular gene.

#### EXAMPLE III

The nucleotide sequence of overlapping cDNA clones was determined by Maxam and Gilbert's chemical degradation method, (*Proceedings of the National Academy of Sciences, USA*, Vol. 74, pp. 560-564 (1977), or Sanger's chain termination method, *Proceedings of the National Academy of Sciences, USA*, Vol. 74, pp. 5463-5467 (1977). Both strands of DNA were sequenced. The nucleotide sequence derived from the 5.5 kb transcript is shown in Figure 2. The DNA sequence of 5105 base pairs (bp) reveals one possible open reading frame consisting of 239 amino acid residues (bcl-2-alpha). The nucleotide sequence corresponding to the 3.5 kb transcript is shown in Figure 3. This transcript codes for a protein consisting of 205 amino acid residues (bcl-2-beta),

which differs from the bcl-2-alpha protein at the carboxyl terminus.

#### Claims

1. A diagnostic method for detecting B-cell neoplasms having t(14;18) translocations in a human, comprising the steps of: isolating B-cells from the human; extracting proteins from said B-cells to form a test sample; contacting said test sample with an antibody which is immunoreactive with a gene product of the human bcl-2 gene under conditions where antibody-antigen complexes form and are stable to form antibody-antigen complexes; quantitating the amount of antibody-antigen complexes formed with said test sample; comparing the amount of antibody-antigen complexes formed with said test sample to the amount formed with a control sample of proteins, a ratio of test sample complexes to control sample complexes of greater than about ten indicating B-cell neoplasm, said control sample of proteins extracted from cells selected from the group consisting of: B-cells from a normal human, cells from an established normal B-cell or pre-B-cell line, and non-B-cells from said human.
2. The method of claim 1 wherein the antibody is radiolabeled and the step of quantitating occurs by measuring the amount of radioactivity in antibody-antigen complexes.
3. The method of claim 1 wherein the antibody is conjugated to a fluorescent molecule and the step of quantitating is performed by measuring the amount of fluorescence emitted by said antibody-antigen complexes.
4. The method of claim 1 wherein said step of quantitating is performed by means of use of a second antibody immunoreactive with said antibody which is immunoreactive with a gene product of bcl-2 gene.
5. The method of claim 1 wherein the antibody is immunoreactive with bcl-2-alpha.
6. The method of claim 1 wherein the antibody is immunoreactive with bcl-2-beta.
7. The method of claim 1 wherein the antibody is immunoreactive with both bcl-2-alpha and bcl-2-beta.
8. A human bcl-2 gene substantially free of introns.
9. The gene of claim 8 wherein said gene is replicated in bacteria.
10. The gene of claim 9 wherein said gene is expressed in bacteria.
11. A substantially pure preparation of protein having an N-terminal end encoded by the first exon of the human bcl-2 gene.
12. The protein preparation of claim 11 wherein said protein is bcl-2-alpha having 239 amino acid residues.
13. The protein preparation of claim 11 wherein said protein is bcl-2-beta having 205 amino acid residues.
14. A diagnostic method for detecting B-cell neoplasms having t(14;18) translocations in a human comprising the steps of: isolating B-cells from the human; extracting RNA from said B-cells to form a test sample; contacting said test sample with a DNA probe containing a sequence of at least 15 nucleotides in length derived from the human bcl-2 gene under conditions where homologous RNA-DNA hybrids form and are stable; quantitating the amount of RNA-DNA hybrids formed in the test sample; and comparing the amount of RNA-DNA hybrids formed with said test sample to the amount formed with a control sample of RNA, a ratio of test sample hybrids to control sample hybrids of greater than about ten indicating B-cell neoplasm, said control sample of RNA extracted from cells selected from the group consisting of: B-cells from a normal human, cells from a normal B-cell or pre-B-cell line, and non-B-cells from said human.
15. The method of claim 14 wherein said DNA probe hybridizes with the 8.5 kb, the 5.5 kb, and the 3.5 kb bcl-2 transcripts.
16. The method of claim 14 wherein said DNA probe hybridizes with the 8.5 kb and the 5.5 kb bcl-2 transcripts.
17. The method of claim 14 wherein said DNA probe hybridizes exclusively with the 3.5 kb bcl-2 transcript.
18. A preparation of an antibody which is (a) immunoreactive with a human bcl-2 protein selected from the group consisting of bcl-2-alpha and bcl-2-beta, and which is (b) not immunoreactive with other human proteins.

19. The preparation of claim 18 which is immunoreactive with both bcl-2-alpha and bcl-2-beta.
20. The preparation of claim 18 or 19 which has been purified from an animal antiserum.
21. The preparation of claim 18, 19 or 20 wherein the antibody is a monoclonal antibody.

#### Patentansprüche

1. Diagnostisches Verfahren zum Nachweis von t-(14;18)-Translokationen aufweisenden B-Zellen-Neoplasmen beim Menschen, das folgende Stufen umfaßt:  
Isolierung der B-Zellen aus dem Menschen, Extraktion der Proteine aus den B-Zellen zur Bildung einer Testprobe, Kontaktierung der Testprobe mit einem Antikörper, der mit einem Genprodukt des menschlichen bcl-2-Gens unter Bedingungen immunreaktiv ist, bei denen Antikörper-Antigen-Komplexe gebildet werden und gegenüber der Bildung von Antikörper-Antigen-Komplexen beständig sind, Quantifizierung der Menge der mit der Testprobe gebildeten Antikörper-Antigen-Komplexe und Vergleich der Menge der mit der Testprobe gebildeten Antikörper-Antigen-Komplexe mit der mit einer Kontrollprobe von Proteinen gebildeten Menge, wobei ein Verhältnis der Testprobenkomplexe zu den Kontrollprobenkomplexen von über ca. 10 B-Zellen-Neoplasmen anzeigt und die Kontrollprobe von Proteinen extrahiert wird aus Zellen, ausgewählt aus der Gruppe, bestehend aus B-Zellen aus einem gesunden Menschen, Zellen aus einer festgelegten normalen B-Zell- oder prä-B-Zelllinie und nicht-B-Zellen aus dem betreffenden Menschen.
2. Verfahren nach Anspruch 1, worin der Antikörper radioaktiv markiert wird und die Stufe der Quantifizierung durch Messung der Menge der Radioaktivität in den Antikörper-Antigen-Komplexen erfolgt.
3. Verfahren nach Anspruch 1, worin der Antikörper mit einem fluoreszierenden Molekül konjugiert wird und die Stufe der Quantifizierung durch Messung der Menge der von den Antikörper-Antigen-Komplexen abgegebenen Fluoreszenz erfolgt.
4. Verfahren nach Anspruch 1, worin die Stufe der Quantifizierung mit Hilfe eines zweiten Antikörpers durchgeführt wird, der gegenüber dem ersten Antikörper immunreaktiv ist, der mit einem Genprodukt des bcl-2-Gens immun-

reaktiv ist.

5. Verfahren nach Anspruch 1, worin der Antikörper gegenüber bcl-2- $\alpha$  immunreaktiv ist.
6. Verfahren nach Anspruch 1, worin der Antikörper gegenüber bcl-2- $\beta$  immunreaktiv ist.
7. Verfahren nach Anspruch 1, worin der Antikörper sowohl gegenüber bcl-2- $\alpha$  als auch gegenüber bcl-2- $\beta$  immunreaktiv ist.
8. Ein im wesentlichen intronfreies menschliches bcl-2-Gen.
9. Das Gen nach Anspruch 8, das in Bakterien repliziert wird.
10. Das Gen nach Anspruch 9, worin das Gen in Bakterien exprimiert wird.
11. Ein im wesentlichen reines Proteinpräparat mit einem N-Terminus, der durch das erste Exon des menschlichen bcl-2-Gens kodiert wird.
12. Proteinpräparat nach Anspruch 11, worin das Protein 239 Aminosäurereste aufweisendes bcl-2- $\alpha$  ist.
13. Proteinpräparat nach Anspruch 11, worin das Protein 205 Aminosäurereste aufweisendes bcl-2- $\beta$  ist.
14. Diagnostisches Verfahren zum Nachweis von t-(14;18)-Translokationen aufweisenden B-Zellen-Neoplasmen beim Menschen, das folgende Stufen umfaßt:  
Isolierung von B-Zellen aus dem Menschen, Extraktion der RNA aus den B-Zellen zur Bildung einer Testprobe, Kontaktierung der Testprobe mit einer DNA-Probe, die eine Sequenz von wenigstens 15 Nukleotiden in der Länge aufweist, die aus dem menschlichen bcl-2-Gen erhalten wurden, unter Bedingungen, bei denen homologe RNA-DNA-Hybride entstehen und beständig sind, Quantifizierung der Menge an in der Testprobe gebildeten RNA-DNA-Hybriden und Vergleich der mit der Testprobe gebildeten Menge an RNA-DNA-Hybriden mit der mit einer Kontrollprobe von RNA gebildeten Menge, wobei ein Verhältnis der Testprobenhybriden zu den Kontrollprobenhybriden von über ca. 10 B-Zellen-Neoplasmen anzeigt und die Kontrollprobe von RNS extrahiert wird aus Zellen, ausgewählt aus der Gruppe, bestehend aus B-Zellen eines gesunden Menschen, Zellen aus einer normalen B-Zell- oder prä-B-Zelllinie und

nicht-B-Zellen aus dem betreffenden Menschen.

15. Verfahren nach Anspruch 14, worin die DNA-Sonde mit dem 8,5 kb-, 5,5 kb- und 3,5 kb-bcl-2-Transkript hybridisiert.

16. Verfahren nach Anspruch 14, worin die DNA-Sonde mit dem 8,5 kb- und 5,5 kb-bcl-2-Transkript hybridisiert.

17. Verfahren nach Anspruch 14, worin die DNA-Sonde ausschließlich mit dem 3,5 kb-bcl-2-Transkript hybridisiert.

18. Präparat eines Antikörpers, der (a) gegenüber einem menschlichen bcl-2-Protein immunreaktiv ist, ausgewählt aus der Gruppe bcl-2- $\alpha$  und bcl-2- $\beta$ , und (b) gegenüber anderen menschlichen Proteinen nicht immunreaktiv ist.

19. Präparat nach Anspruch 18, das sowohl gegenüber bcl-2- $\alpha$  als auch gegenüber bcl-2- $\beta$  immunreaktiv ist.

20. Präparat nach Anspruch 18 oder 19, das durch Reinigung aus einem tierischen Antiserum gewonnen wurde.

21. Präparat nach Anspruch 18, 19 oder 20, worin der Antikörper ein monoklonaler Antikörper ist.

#### Revendications

1. Procédé diagnostique pour la détection de néoplasmes à cellules B ayant les translocations t(14;18) chez un homme, comprenant les étapes suivantes : isolation des cellules B de l'homme; extraction des protéines à partir de ces cellules B pour former un échantillon d'essai; mise en contact de cet échantillon d'essai avec un anticorps qui est immunoréactif avec un produit génique du gène bcl-2 humain dans des conditions dans lesquelles les complexes anticorps-antigène se forment et sont stables pour former des complexes anticorps-antigène; détermination de la quantité de complexes anticorps-antigène formés avec cet échantillon d'essai; comparaison de la quantité de complexes anticorps-antigène formés avec cet échantillon d'essai à la quantité formée avec un échantillon témoin de protéines, un rapport des complexes de l'échantillon d'essai aux complexes de l'échantillon témoin supérieur à environ 10 indiquant un néoplasme à cellules B, cet échantillon témoin de protéines extraites provenant de cellules sélectionnées dans le groupe consistant en cellules B provenant d'un

homme normal, cellules provenant d'une lignée de cellules B normale établie ou de pré-cellules B et cellules non B provenant de cet homme.

2. Procédé suivant la revendication 1, dans lequel l'anticorps est radiomarké et l'étape de détermination quantitative est réalisée par mesure de la quantité de radioactivité dans les complexes anticorps-antigène.

3. Procédé suivant la revendication 1, dans lequel l'anticorps est conjugué à une molécule fluorescente et l'étape de détermination quantitative est réalisée par mesure de la quantité de fluorescence émise par ces complexes anticorps-antigène.

4. Procédé suivant la revendication 1, dans lequel cette étape de détermination quantitative est réalisée au moyen d'un second anticorps immunoréactif avec cet anticorps qui est immunoréactif avec un produit génique du gène bcl-2.

5. Procédé suivant la revendication 1, dans lequel l'anticorps est immunoréactif avec bcl-2- $\alpha$ .

6. Procédé suivant la revendication 1, dans lequel l'anticorps est immunoréactif avec bcl-2- $\beta$ .

7. Procédé suivant la revendication 1, dans lequel l'anticorps est immunoréactif à la fois avec bcl-2- $\alpha$  et bcl-2- $\beta$ .

8. Gène bcl-2 humain pratiquement dépourvu d'introns.

9. Gène suivant la revendication 8, dans lequel ce gène est répliqué dans des bactéries.

10. Gène suivant la revendication 9, dans lequel ce gène est exprimé dans des bactéries.

11. Préparation pratiquement pure de protéine ayant une extrémité N-terminale codée par le premier exon du gène bcl-2 humain.

12. Préparation de protéine suivant la revendication 11, dans laquelle cette protéine est bcl-2- $\alpha$  ayant 239 résidus d'acide aminé.

13. Préparation de protéine suivant la revendication 11, dans laquelle cette protéine est bcl-2- $\beta$  ayant 205 résidus d'acide aminé.

14. Procédé diagnostique pour la détection de néoplasmes à cellules B ayant les transloca-

- tions t(14;18) chez un homme, comprenant les étapes suivantes : isolation des cellules B de l'homme; extraction de l'ARN de ces cellules B pour former un échantillon d'essai; mise en contact de cet échantillon d'essai avec une sonde d'ADN contenant une séquence longue d'au moins 15 nucléotides provenant du gène bcl-2 humain dans des conditions dans lesquelles des hybrides homologues ARN-ADN se forment et sont stables; détermination de la quantité d'hybrides ARN-ADN formés dans l'échantillon d'essai; et comparaison de la quantité d'hybrides ARN-ADN formés avec cet échantillon d'essai à la quantité formée avec un échantillon témoin d'ARN, un rapport d'hybrides dans l'échantillon d'essai aux hybrides dans l'échantillon témoin supérieur à environ 10 indiquant un néoplasme à cellules B, cet échantillon témoin d'ARN étant extrait à partir de cellules sélectionnées dans le groupe consistant en cellules B provenant d'un homme normal, cellules provenant d'une lignée de cellules B normale ou de pré-cellules B et cellules non B provenant de cet homme.
15. Procédé suivant la revendication 14, dans lequel cette sonde d'ADN s'hybride avec les transcripts de 8,5 kb, de 5,5 kb et de 3,5 kb de bcl-2.
16. Procédé suivant la revendication 14, dans lequel cette sonde d'ADN s'hybride avec les transcripts de 8,5 kb et de 5,5 kb de bcl-2.
17. Procédé suivant la revendication 14, dans lequel cette sonde d'ADN s'hybride exclusivement avec le transcript de 3,5 kb de bcl-2.
18. Préparation d'un anticorps, qui est (a) immunoréactive avec une protéine bcl-2 humaine choisie dans le groupe consistant en bcl-2-alpha et bcl-2-béta, et qui est (b) non immunoréactive avec d'autres protéines humaines.
19. Préparation suivant la revendication 18, qui est immunoréactive à fois avec bcl-2-alpha et bcl-2-béta.
20. Préparation suivant les revendications 18 ou 19, qui a été purifiée à partir d'un antisérum humain.
21. Préparation suivant les revendications 18, 19 ou 20, dans laquelle l'anticorps est un anticorps monoclonal.
